

## Benefits Offered by Current-Limiting Fuses

### High Interrupting Rating of 200,000 Amps or More

Modern current-limiting fuses have high interrupting ratings at no extra cost. Whether for the initial installation or system updates, a fusible system can maintain a sufficient interrupting rating. This helps with achieving high assembly short-circuit current ratings. See *Fuseology – Interrupting Rating details*.

### Type 2 Protection

Type 2 “No Damage” protection of motor starters when applied properly. See *Motor Starter Protection – Type 1 versus Type 2 protection*.

### High SCCR

High assembly short-circuit current ratings can be achieved. See *Industrial Control Panels – SCCR*.

### Rejection Features

Modern current-limiting fuses have rejection features which, when used with rejection fuse clips, assure replacement with a device of the same voltage rating and equal or greater interrupting rating. In addition, rejection features restrict the fuses used for replacement to ones of the same class or type.

### Flexibility

Increased flexibility in panel use and installation. Valuable time that was spent gathering information for proper application is drastically reduced with fuses since:

- Fuses can be installed in systems with available fault currents up to 200kA or 300kA covering the majority of installations that exist.
- Fuses can handle line-to-ground fault currents up to their marked interrupting rating.
- Fuses have a straight voltage rating instead of a slash voltage rating. A device with a slash voltage rating is limited to installation in ONLY a solidly grounded wye type system. Fuses can be installed in any type of installation independent of the grounding scheme used.

### Reliability

Fuses provide reliable protection throughout the life of the installation. After a fault occurs, fuses are replaced with new factory calibrated fuses assuring the same level of protection that existed previous to the fault.

### No Venting

Fuses do not VENT. Therefore fuses will not affect other components in the panel while clearing a fault. Additional guards or barriers are not required.

### Helps Regulation Compliance

Resetting or replacing fuses in a circuit without investigating the cause is prohibited in OSHA CFR29:1910-334. Fuses are not resettable and eliminate the invitation to reset.

### Workplace Safety

Superior current limitation provides enhanced workplace safety. See *Electrical Safety*.

### Component Protection Via Current Limitation

Current limitation provides protection of circuit components for even the most susceptible components such as equipment grounding conductors. See *Component Protection and Industrial Control Panels – SCCR*.

### Selective Coordination

Achieving selective coordination is simple. Typically selective coordination can be achieved between current-limiting fuses by simply maintaining a minimum amp ratio between upstream and downstream fuses. This can aid in diagnostics within the building electrical system or machine panel as only the affected circuit is isolated. Selective coordination helps isolate faulted circuits from the rest of the system and prevents unnecessary power loss to portions of a building. See *Selective Coordination*.

## Specify the Bussmann Low-Peak™ System

- Safety Built-in rejection features
- Selective coordination with a minimum 2:1 ratio
- Maximum current-limiting protection for distribution equipment
- Type “2” Protection for motor starters
- Only one type of fuse throughout building
- Reduces inventory
- 300,000A interrupting rating
- Help reduce arc flash hazard
