Feature Interactions In Telecommunications Systems:

Feature Interactions in Telecommunications Systems, III Kong E. Cheng, Tadashi Ohta, 1995 In an information society heavily dependent on communications and distributed systems feature interactions are likely to become an even more important problem than they are today A particularly interesting issue given the current work on agents is whether feature interactions will be more likely in systems with many autonomous agents performing tasks The current demand for better and more convenient communications requires development of a variety of new services as quickly as possible As the number of services becomes larger however feature interactions create incompatibilities between the various functions needed to implement them In developing telecommunication systems we now spend huge numbers of person hours on software modifications and testing whenever a new function is added Much of this time is spent on detecting and eliminating problems arising from feature interaction In the future as ever more services are offered feature interactions will become a major bottleneck in the development of software for telecommunications systems This book presents opinions on the technical problems involved in feature interactions and definitions of features and feature interactions

Feature Interactions in Software and Communication Systems IX, 2008 This publication deals with the feature interaction problem in telecommunication systems In this domain an interaction occurs when one telecommunications feature service modifies or subverts the operation of another one Undesired interactions can both lower this quality and delay service provisioning Therefore the problem of feature interactions in telecommunications is of great importance In the past decade a lot of attention has been devoted to the development of methods for detection and resolution of feature interactions However this feature interaction phenomenon is not unique to the domain of telecommunications systems It can also occur in any large software system that is subject to continuous changes All the submitted papers in this publication have been peer reviewed by at least two reviewers drawn from industry or academia

Feature Interactions in Telecommunications Systems L. G. Bouma, H. Velthuisen, 1994 Features are modifications to the control of telecommunications services A feature interaction occurs when the behaviour of another which can lead to unexpected or undesired behaviour which affects the quality of service The goal of this volume is to generate a combination of techniques through protocol engineering software testing formal techniques and AI and applications to telecommunications services

Feature Interactions in Telecommunications and Software Systems V K. Kimbler, L. G. Bouma, 1998 The LabManual is a valuable tool designed to enhance your lab experience Lab activities objectives materials lists step by step procedures illustrations and review questions are commonly found in a Lab Manual

Detecting Feature Interactions in Telecommunications Systems Designs Mohammed Faci, 1995 A basic telephone service is used to establish a communication session between two users A telephone feature such as call waiting call forwarding and three way calling is defined as an added functionality of the basic telephone service A feature interaction is the interference of the functionality of one telephone feature with the functionality of another

telephone feature meaning that the invocation of the first feature modifies the functionality of the other active feature or even prevents its functionality altogether This problem has become a major obstacle for the extension of telephone systems with new services Our contributions in this thesis are the following 1 define a model for specifying telephone systems and their services 2 formalize the notion of feature interaction and 3 develop a design methodology for detecting feature interactions at the specification level In the first part of the thesis we define a model for structuring the components of telephone specifications In this model a specification is expressed as a set of communicating processes representing three types of constraints local constraints end to end constraints and global constraints Each of these constraints is defined and used in our specifications In the second part of the thesis we develop a methodology for detecting feature interactions Central to our methodology is the formalization of the notion of feature interaction Intuitively we say that an interaction exists between n features if one of the features cannot exhibit its behaviour when integrated into POTS in combination with other features We formalize this concept by defining the composition and integration of features Composition expresses the synchronization of features on their common actions with POTS and their interleaving on their independent actions Integration expresses the extension of POTS with the n features such that each feature is able to execute all of its actions which are allowed in the context of POTS when the other features are disabled Then we reason about interactions in terms of the conformance relation studied in testing theory in the following way An interaction exists between n features if their integration does not conform to their composition A set of concrete telephony examples is used to show the applicability of the methodology The specification language used is LOTOS which turns out to be ideally suited to express our methodology However our method is general enough to be adapted to other specification languages with similar constructs

Feature Interactions in Software and Communication Systems X M. Nakamura, S. Reiff-Marganiec, 2009-05-29 The International Conference on Feature Interactions in Software and Communication Systems ICFI has evolved out of the Feature Interaction Workshop FIW which started in 1992 as the leading forum for discussion and reporting on research on feature interactions in telecommunications systems It is now concerned with feature interaction in all types of software systems Participation includes practitioners researchers and educators The proceedings have been published by IOS Press since 1994

Feature Interactions in Telecommunications and Software Systems VIII Stephan Reiff-Marganiec, Mark D. Ryan, 2005 Features additional services occur whenever organisations compete by differentiating their products from those of rival organisations Adding one feature may break another or interfere with it in an undesired way This phenomenon is called feature interaction This book explores ways in which the feature interaction problem may be mitigated

Feature Interactions in Software and Communication Systems IX Lydie Du Bousquet, J. L. Richier, 2008 This publication deals with the feature interaction problem in telecommunication systems In this domain an interaction occurs when one telecommunications feature service modifies or subverts the operation of another one Undesired interactions can both lower this quality and delay service

provisioning Therefore the problem of feature interactions in telecommunications is of great importance In the past decade a lot of attention has been devoted to the development of methods for detection and resolution of feature interactions However this feature interaction phenomenon is not unique to the domain of telecommunications systems It can also occur in any large software system that is subject to continuous changes All the submitted papers in this publication have been peer reviewed by at least two reviewers drawn from industry or academia

Feature Interactions in Telecommunications and Software Systems VII Daniel Amyot, Luigi Logrippo, 2003 Feature interaction is a phenomenon known to the designers of modern telephone switching systems This phenomenon occurs when one feature modifies or subverts the operation of another one This work brings together representatives of the telecommunications industry and the software industry

Feature Interactions in Telecommunications and Software Systems VI Muffy Calder, Evan Magill, 2000 Typically telecommunications services are implemented in software Feature interaction is the term used to describe interference between services or features most attention is given to cases where the interference is undesirable ie there is an incompatibility In telecommunications control and data is distributed and on such a large scale that software development is by numerous disjoint teams by its nature therefore this software experienced the feature interaction problem first But while the workshop focuses on communications services the subject has relevance to any domain where separate software entities control a shared resource
