

This theme is introduced in chapter 2, and most of the following chapters have major sections devoted to issues of automatic versus controlled processes. This emphasis produces some clear advantages for the book, most noticeably in the chapters on decision making and on cognitive development.

The coverage includes the fairly familiar topics of attention, representation (two chapters), storage and retrieval, problem solving, and decision making (with an emphasis on the role of representation as well as the controlled-automatic contrast). The breadth of the treatment is exemplified in chapters on consciousness, including hemispheric differences and biorhythms; on reading, with an interesting introduction on writing systems; and on individual differences in cognitive ability (perhaps the weakest chapter in the book).

Each chapter concludes with a set of fairly complex questions, e.g., "Why is it hard to assess whether memory is permanent?" "How might you refute the view that word recognition is a letter-by-letter process?" If students attempt to answer the questions, they would of necessity process the material rather thoroughly. Because of the nature of the questions, however, students may have difficulty, without external feedback, in ascertaining the depth and accuracy of their own understanding. For the questions to be really useful, it would seem necessary to assign them as homework or perhaps even as announced-in-advance examination questions.

The book has noticeable, positive features. The organizing theme gives coherence to the material. The writing style is direct, with occasional humor and periodic references to the author's personal experiences to illustrate topics under discussion. There is an ample bibliography of over 500 references, although the book itself is rather brief, having 10 core chapters averaging 28 pages. A shortcoming is that illustrations are relatively scarce, giving the book a somewhat dull appearance and sometimes resulting in unnecessarily complicated text descriptions.

The author states that he opted for broad coverage in response to student opinion, and it seems likely that students will appreciate the range of topics presented. This choice is not without risks, however. In a number of instances, topics seem to be merely introduced without sufficiently detailed discussion. In these cases, instructors may wish the book were longer, precisely to provide more depth to the presentation.

Roger L. Dominowski, *University of Illinois, Chicago*

### **The Expression of Knowledge: Neurobehavioral Transformations of Information into Action**

Edited by Robert L. Isaacson and Norman E. Spear. New York: Plenum, 1982. 423 pp. \$39.50.

Those who edit books are increasingly on the defensive. A coincidence of lectures in space and time no longer suffices to justify publication. There has to be a common theme. The editors of this book have a great theme: "Given what we know, why do we not always do what we should do?" (p. 1).
