It is a great text on basic concepts in physics over a wide range of topics with a truly broad coverage which makes it a source book of unique value to students of physics, one that will be of use for teachers of the subject too. Students and teachers in related subjects like chemistry, biology, and the various engineering disciplines will also benefit greatly from it. The book is completely modern in approach and is exhaustive and authentic. The presentation is exceptionally lucid and captures the essential charm of physics. All the concepts are developed from elementary considerations and are built up to quite advanced levels without loss of coherence, simplicity, or elegance. The mathematics is essentially at the high school level, and relatively advanced mathematical ideas have all been built up in a self-contained manner.

What is the principle of similitude? What are polar and axial vectors? What is a wrench? How are sliding and rolling friction explained? What is an anharmonic oscillator? What is tidal force? How are the principal components of strain and stress defined? How does the time period of angular oscillations of a floating body depend on the metacentric height? What is boundary layer separation? What is the entropy principle? How does the Doppler formula look in the case of accelerated motion of the source and the observer? What is the relevance of diffraction in image formation? What is electrostatic shielding? What is the pathway of energy flow in an electrical circuit? What is ferromagnetism? What is back EMF in a DC motor? What are metamaterials? What are the basic features of Rayleigh scattering? What is population inversion in laser operation? How are harmonic oscillators relevant in the explanation of the black body spectrum? What is relativistic aberration? What is spin-orbit coupling? What are the features of an op-amp? What is a SR flip-flop? For answers to all these and to a host of other relevant questions, you have to turn to the pages of this book. Science Matters, but Does it in Economics? Bernard C. Beaudreau, 2023-08-30 Does science matter in economics It is generally agreed that economics is an applied science and not a pure one In general applied sciences are based on the laws

and principles of pure science A good example is biology where the only laws that are invoked are those of physics specifically the laws of classical mechanics and thermodynamics Chemistry is another example where the only laws that are invoked are those of physics It is also generally agreed that economics draws from the tributary fields of industrial engineering and psychology with the former underlying production and the latter consumption and behavior in general But is this the case Beyond hyperbole is production theory truly grounded in the laws of industrial engineering And is consumption theory grounded in behavioral psychology This volume answers these questions in the negative In short it is argued that science simply doesn't matter in economics has never mattered and will probably never matter Instead the field has taken it upon itself to redefine the laws of physics as they relate to work and productivity and of psychology as they relate to human behavior in short to carve out a set of laws which is distinct from physics and psychology
