    Handwriting Recognition Zhi-Qiang Liu,Jin-Hai Cai,Richard Buse,2012-11-07 Over the last few decades research on handwriting recognition has made impressive progress The research and development on handwritten word recognition are to a large degree motivated by many application areas such as automated postal address and code reading data acquisition in banks text voice conversion security etc As the prices of scanners com puters and handwriting input devices are falling steadily we have seen an increased demand for handwriting recognition systems and software pack ages Some commercial handwriting recognition systems are now available in the market Current commercial systems have an impressive performance in recognizing machine printed characters and neatly written texts For in stance High Tech Solutions in Israel has developed several products for container ID recognition car license plate recognition and package label recognition Xerox in the U S has developed TextBridge for converting hardcopy documents into electronic document files In spite of the impressive progress there is still a significant perfor mance gap between the human and the machine in recognizing off line unconstrained handwritten characters and words The difficulties encoun tered in recognizing unconstrained handwritings are mainly caused by huge variations in writing styles and the overlapping and the interconnection of neighboring characters Furthermore many applications demand very high recognition accuracy and reliability For example in the banking sector although automated teller machines ATMs and networked banking sys tems are now widely available many transactions are still carried out in the form of cheques   Text Entry Systems I. Scott MacKenzie,Kumiko Tanaka-Ishii,2010-07-28 Text Entry Systems covers different aspects of text entry systems and offers prospective researchers and developers global guidelines for conducting research on text entry in terms of design strategy evaluation methodology and requirements a discussion of the history and current state of the art of entry systems and specific guidelines for designing entry systems for a specific target depending on devices modalities language and different physical conditions of users Text entry has never been so important as it is today This is in large part due to the phenomenal relatively recent success of mobile computing text messaging on mobile phones and the proliferation of small devices like the Blackberry and Palm Pilot Compared with the recent past when text entry was primarily through the standard qwerty keyboard people today use a diverse array of devices with the number and variety of such devices ever increasing The variety is not just in the devices but also in the technologies used entry modalities have become more varied and include speech recognition and synthesis handwriting recognition and even eye tracking using image processing on web cams Statistical language modeling has advanced greatly in the past ten years and so therein is potential to facilitate and improve text entry increasingly the way people communicate This book covers different aspects of text entry systems and offers prospective researchers and developers Global guidelines for conducting research on text entry in terms of design strategy evaluation methodology and requirements History and current state of the art of entry systems including coverage of recent research topics Specific guidelines for designing entry systems
