*Artificial Intelligence & Games* Georgi Togeli, 2024-09-03 As has been pointed out by several industrial game AI developers the lack of behavioral modularity across games and in game tasks is detrimental for the development of high quality AI 605 171 An increasingly popular method for ad hoc behavior authoring that eliminates the modularity limitations of FSMs and BTs is the utility based AI approach which can be used for the design of control and decision making systems in games 425 557 Following this approach instances in the game get assigned a particular utility function that gives a value for the importance of the particular instance 10 169 For instance the importance of an enemy being present at a particular distance or the importance of an agent's health being low in this particular context Given the set of all utilities available to an agent and all the options it has utility based AI decides which is the most important option it should consider at this moment 426 The utility based approach is grounded in the utility theory of economics and is based on utility function design The approach is similar to the design of membership functions in a fuzzy set A utility can measure anything from observable objective data e.g enemy health to subjective notions such as emotions mood

and threat The various utilities about possible actions or decisions can be aggregated into linear or non linear formulas and guide the agent to take decisions based on the aggregated utility The utility values can be checked every n frames of the game So while FSMs and BTs would examine one decision at a time utility based AI architectures *Hands-On Java Deep Learning for Computer Vision* Klevis Ramo,2019-02-21 Leverage the power of Java and deep learning to build production grade Computer Vision applications Key FeaturesBuild real world Computer Vision applications using the power of neural networks Implement image classification object detection and face recognitionKnow best practices on effectively building and deploying deep learning models in JavaBook Description Although machine learning is an exciting world to explore you may feel confused by all of its theoretical aspects As a Java developer you will be used to telling the computer exactly what to do instead of being shown how data is generated this causes many developers to struggle to adapt to machine learning The goal of this book is to walk you through the process of efficiently training machine learning and deep learning models for Computer Vision using the most up to date techniques The book is designed to familiarize you with neural networks enabling you to train them efficiently customize existing state of the art architectures build real world Java applications and get great results in a short space of time You will build real world Computer Vision applications ranging from a simple Java handwritten digit recognition model to real time Java autonomous car driving systems and face recognition models By the end of this book you will have mastered the best practices and modern techniques needed to build advanced Computer Vision Java applications and achieve production grade accuracy What you will learnDiscover neural networks and their applications in Computer VisionExplore the popular Java frameworks and libraries for deep learningBuild deep neural networks in Java Implement an end to end image classification application in JavaPerform real time video object detection using deep learningEnhance performance and deploy applications for productionWho this book is for This book is for data scientists machine learning developers and deep learning practitioners with Java knowledge who want to implement machine learning and deep neural networks in the computer vision domain You will need to have a basic knowledge of Java programming
