

Combinatorial formula for the M invariant of magnetic lines

Akhmetiev P.M.

December 25, 2024

Abstract

To solve MHD problems within the framework of the theory of two-scale mean fields, it is important to study the invariants of magnetic lines. Such invariants are constructed on the basis of invariants of classical links, which must satisfy the asymptotic property. We choose the simplest asymptotic invariant M_3 of three-component links, which is not expressed in terms of the pairwise linking coefficients of the components. We check the asymptotic property based only on the combinatorial definition of the invariant and do not use the analytic integral. For simple examples, the proven formula is verified by calculation.

1 Introduction

Many celestial bodies have magnetic fields, which, as follows from modern scientific knowledge, are generated by the movement of a conducting liquid medium [1], [2], [3]. This process is known as the dynamo process. The dynamo converts the kinetic energy of the movement of a liquid medium into magnetic energy. The spatial scale of the generated magnetic fields is comparable to the size of the celestial body. Such magnetic fields are called large-scale. The dynamo that generates them is called large-scale.

In dynamo theory, it is generally accepted that the properties of a large-scale dynamo are determined by the behavior of the system on a small scale, which is a hierarchy, and the connection with the large-scale field is described by the mean field equation. The small-scale field is mixed at each scale by the fast field of hydrodynamic velocity of the liquid conducting medium. The large-scale field is the result of averaging the small-scale field. The small-scale field is close to an ideal magnetic field, which is transformed as a
