

Evolving Earth

Our planet passed through vastly different stages on its way to becoming a habitable world.

Earth Forms

Our world accreted from a Sun-orbiting disk of gas and dust about 4.5 billion years ago – then collided with a Mars-sized body about 50 million years later, leading to formation of the Moon.

Earth Cools

The surface cooled rapidly, achieving a hot but solid crust, with early oceans and impact basins filled with lava by about 4.3 billion years ago.

Life Begins

The earliest life-forms might have appeared during the Archaean Era some 3.7 billion years ago – or even earlier. Oceans could have been tinged green by iron ions. Life-forms relying on oxygen, and an oxygenated atmosphere, did not arise until much later.

Earth Today

Our world of abundant life, with its oxygen-rich atmosphere, likely would be recognized as habitable from many light-years away. But the presence of oxygen might not have been detectable even as recently as 500-600 million years ago.
